

Disclose replacement API definition: document object

This is the definition of the document object type returned in responses for various Disclose API operations.

Document purpose

This document outlines the data fields that will be exposed in the upcoming Disclose REST API, intended to support developers in preparing for the migration from the legacy SOAP-based services. It includes a mapping between the proposed JSON field names and their counterparts in the existing SOAP XML schema and the new Disclose Register web interface.

Please note that this document does not represent the finalised API design. The attributes listed may reside within nested objects or structures not detailed here. A complete OpenAPI Specification (OAS) will be published following the completion of the API design and initial development phases, enabling consumers to begin integration and implementation work.

API endpoints

The document object is returned within the response of several API operations and within arrays of paginated data in these endpoints:
