IPONZ v5 API Data Dictionary – Download Document Operation

This document provides additional information for the request and response data fields used in the IPONZ v5 API POST /download-document operation.

For convenience the following data dictionary of request and response content is a flattened version of the XML structure.

REQUEST DATA DICTIONARY

Field	Optional/ required	Description
ObjectIdentifier *String*	Required	The alphanumeric identifier of a document to be retrieved by IPONZ, e.g. 090000018087a2ea. This identifier will usually have been returned from another API operation: Trade Mark Information, Patent Information, Design Information, Trade Mark Search, Task Correspondence, or Discussion Correspondence.

RESPONSE DATA DICTIONARY

Field	Description
TransactionIdentifier *String*	A unique identifier generated for the API transaction that can be used to assist MBIE support if problems occur.
TransactionCode *Fixed string*	Get Object
ObjectIdentifier *String*	The identifier of the requested document.
ObjectFormat *String*	The document format. Most documents will be pdf format, while images are typically jpeg or gif.

Field	Description
ObjectName *String*	The name of the document as shown in the IPONZ online system.
ObjectData *Binary*	The Base64 encoded representation of the document.
TransactionErrorCode *Token (String)*	Either *App Error* or *Fault Error* *App Error* generally indicates that the request cannot be carried out as a valid document identifier has not been included in the request. *Fault Error* indicates an unexpected error with the web service itself.
TransactionErrorText *String*	Description of the specific error. This will usually be: The document has not been found or user doesn't have permission to view it
